

OMERO and PSLID

Robert F. Murphy

Lane Center for Computational Biology

Carnegie Mellon University

PSLID mission and overview

Determination of Protein Location from Microscopy Images

- Location Proteomics: Providing information about subcellular protein location
 - (dynamic) proteome map to understand normal and abnormal cell behaviors
 - clues for interaction/regulation of proteins
 - clues for protein function
- Data driven: Determination of location for all proteins from microscopy images

CD-tagging collection

- **Proteome-scale, live cell imaging of tagged proteins**
- Using **CD-tagging** (developed by Jonathan Jarvik and Peter Berget):
Infect population of cells with a retrovirus carrying DNA sequence that will “tag” in a random gene *in its genomic context*
- Isolate separate clones, each of which produces express one tagged protein
- Use RT-PCR to identify tagged gene in each clone
- Collect many live cell images for each clone using fluorescence microscopy

Protein Subcellular Location Image Database

PSLID - Protein Subcellular Location Image Database

[Go to the PSLID database containing CD-tagged NIH 3T3 cell clones](#) **New!**

[Go to the PSLID Public Database Release 4](#) (released August 1, 2008)

[Download datasets contained within PSLID](#)

Supported by the National Institute of General Medical Sciences, Grant GM075205

PSLID RandTag collection Release 2

- 4441 GFP-tagged 3T3 cell clones
- 15-25 images were acquired by automated microscopy (IC100) for each clone for a total of ~140,000 images. Of those, ~50,000 were classified as unusable (out of focus, debris containing, too few cells) so only ~90,000 images appear in the final sets.
- ~300 distinct proteins identified; tagged protein in remaining clones being identified by sequencing
- 667 images from confocal microscopy images for interesting clones
- Release 2 to be release on July 11, 2010 (ISMB meeting)

PSLID principles

- Fundamental unit is a set
- Elements of sets strongly typed
 - 2D, 3D, ...
 - image, cell, object...
- Analysis results stored in DB, linked to element
- Meta analysis
- Search by image content

Dynamic proteomics in individual huma... View by Plate PSLID Service http://pslid3.cbi...!%20protein%20S28

Experiment: 3T3-CDtag-CZ1
Microscope: IC100
Set Name: CZ1D5 IC100

The image displays a 4x5 grid of 20 fluorescence microscopy images. Each image shows a field of cells, likely 3T3 cells, stained with three different fluorescent dyes: red (likely DAPI for nuclei), green (likely a cytoplasmic or membrane stain), and blue (likely a specific protein or organelle stain). The cells are densely packed, and the staining pattern varies across the different images in the grid, showing different cellular structures and protein localization. The background is dark, and the stained cells appear as bright, colorful spots and shapes.

- [Version 2.3: July 17, 2006 - integrated table viewer and ER diagram](#)
- [Version 3.0: December 15, 2006 - integrated table viewer and ER diagram](#)
- [Version 5.0: August 1, 2009 - database specifications & ER Diagram](#)

FMAS schema

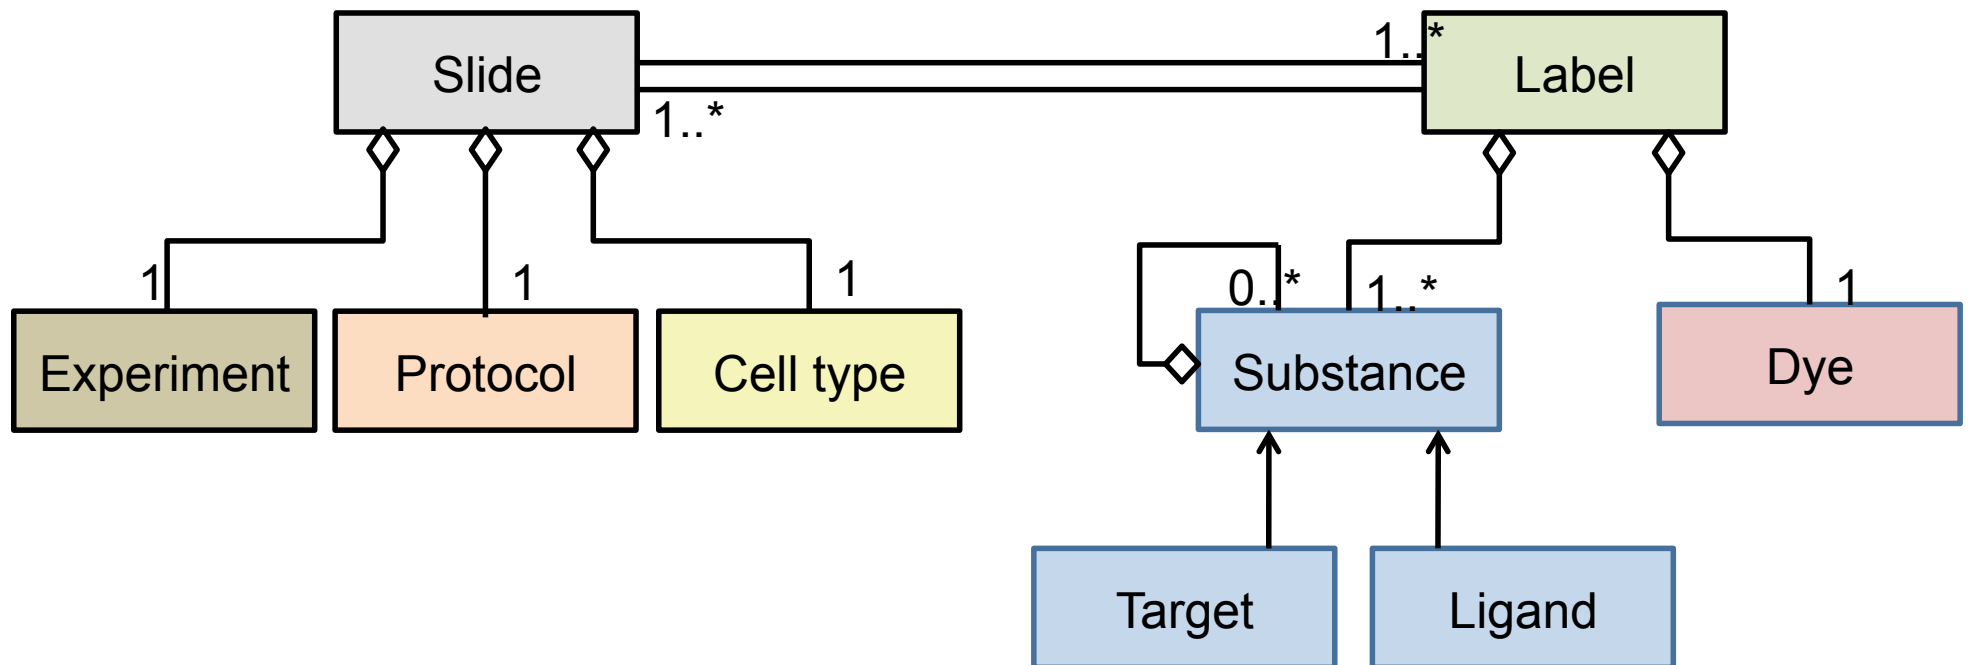

Importing into OMERO

- OME TIFF with PSLID custom annotations
 - Works with current OMERO.importer
 - Can't load/read custom annotations
 - should be fixed in OMERO 4.2
- Currently require additional import into PSLID server to capture the rest of the annotations

Adding PSLID tags to OME-XML

- Description of cell lines, reagents and probes in sample
- Features, classifications, and other results from analysis

Sample Description

Target reasoning

- Annotations specify
 - excitation wavelength and emission filters for each image
 - labels (substances, dyes) present in each sample
- Code reasons out which target substance is visualized in each image

Welcome, demo

Sample Labeling and Target Reasoning

The current target for this image is: *Lysosomal membrane glycoprotein 2*

Based on the sample labeling and image collection descriptions, the target of this image can be inferred as follows:

The dye(s) used in this sample is (are): *Cy5, DAPI*

The emission filter used for this image is: *Cy5 em filter*

The wavelength range of this filter is: *665 nm - 740 nm*

The dye in this sample that matches the filter is: *Cy5 (peak emission 670 nm)*

The sample is labeled with *Cy5*, which is attached to *goat IgG*.

The sample is labeled with *goat IgG anti mouse IgG*, which is *goat IgG* whose target is *mouse IgG*.

The sample is labeled with *mouse IgG anti LAMP2*, which is *mouse IgG* whose target is *Lysosomal membrane glycoprotein 2*.

Therefore, by reasoning, the final target is: *Lysosomal membrane glycoprotein 2*

The reasoned target agrees with the current target.

Do you want to do such target reasoning for all the images in this set?

☐ Yes ☐ No

The current target for this image is: *Lysosomal membrane glycoprotein 2*

Based on the sample labeling and image collection descriptions, the target of this image can be inferred as follows:

The dye(s) used in this sample is (are): *Cy5, DAPI*

The emission filter used for this image is: *Cy5 em filter*

The wavelength range of this filter is: *665 nm - 740 nm*

The dye in this sample that matches the filter is: *Cy5 (peak emission 670 nm)*

The sample is labeled with *Cy5*, which is attached to *goat IgG*.

The sample is labeled with *goat IgG anti mouse IgG*, which is *goat IgG* whose target is *mouse IgG*.

The sample is labeled with *mouse IgG anti LAMP2*, which is *mouse IgG* whose target is *Lysosomal membrane glycoprotein 2*.

Therefore, by reasoning, the final target is: *Lysosomal membrane glycoprotein 2*
The reasoned target agrees with the current target.

Do you want to do such target reasoning for all the images in this set?

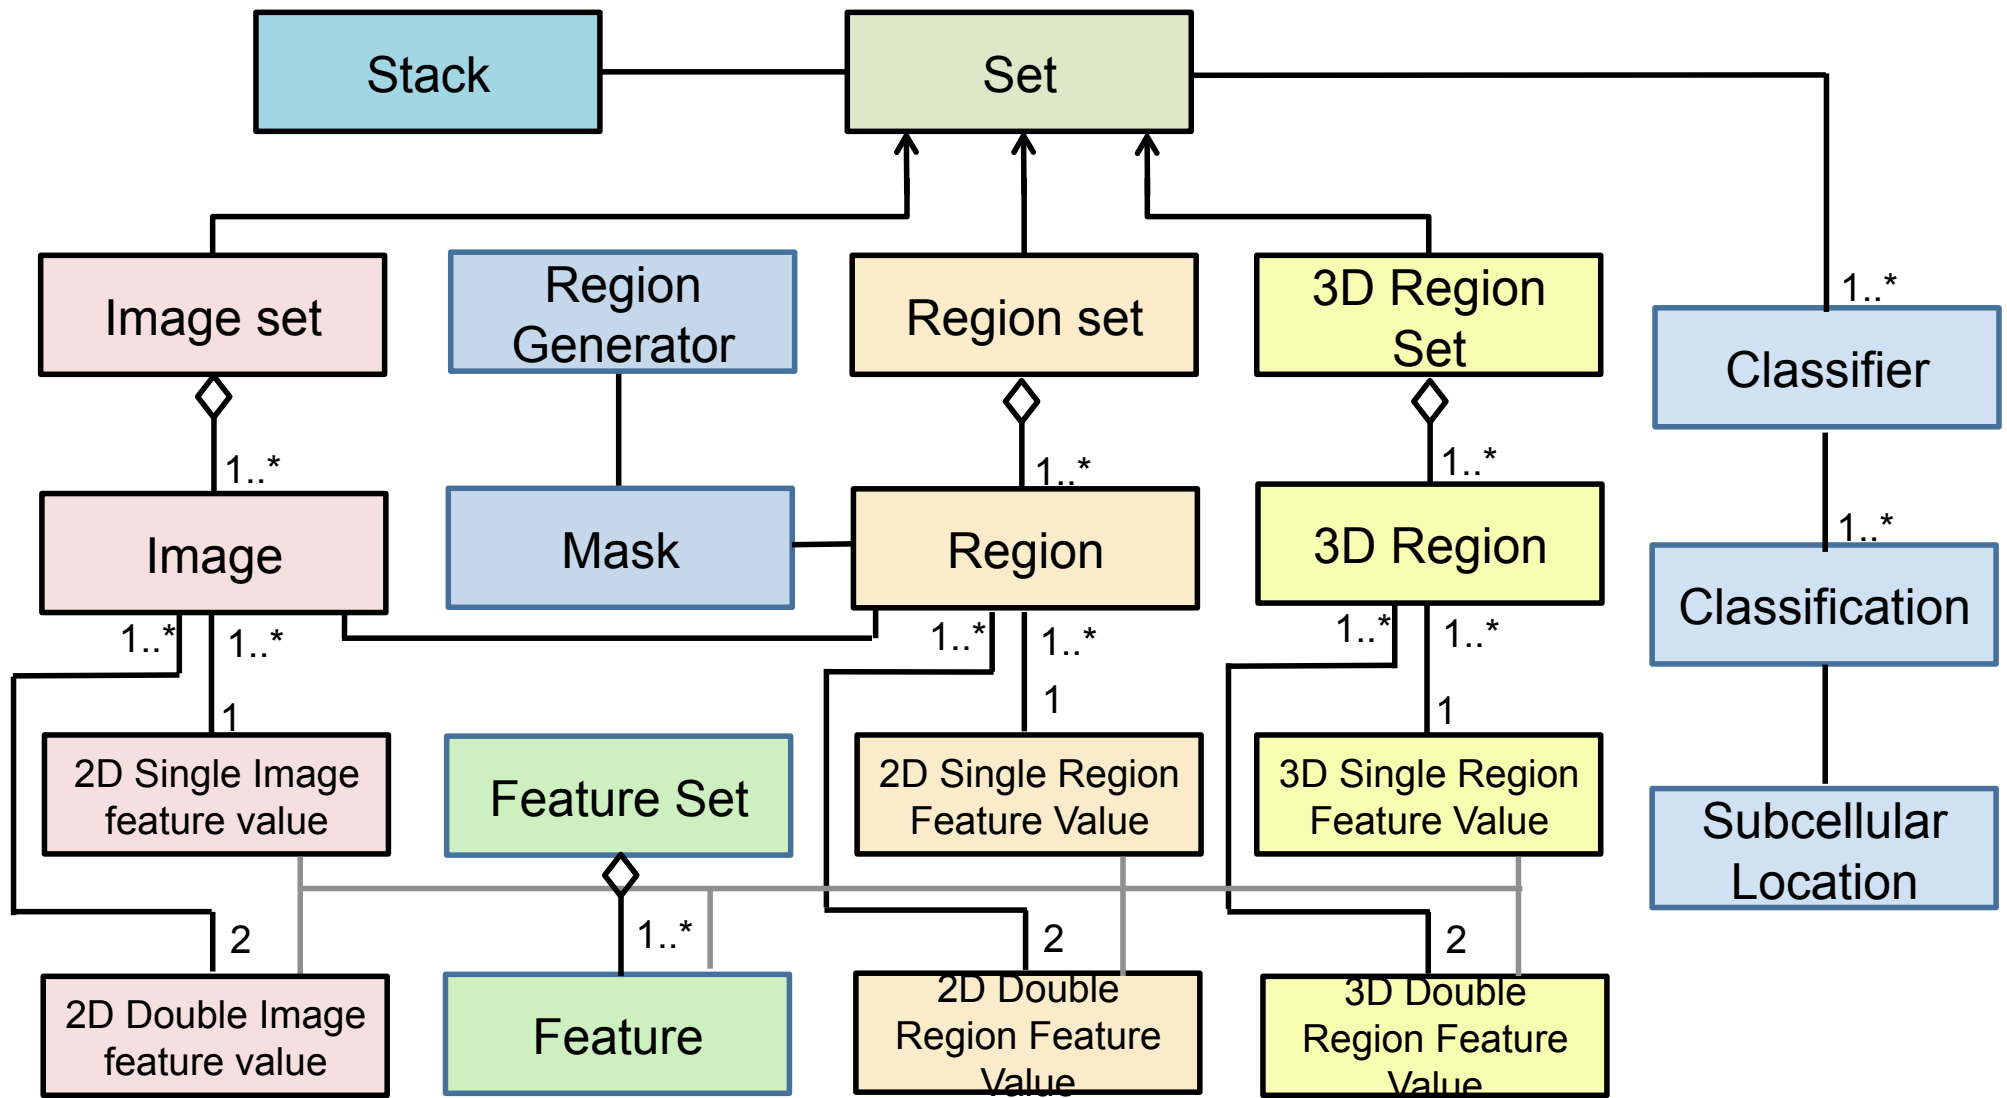

Yes

No

Target reasoning

- Permits identification of generalizations and specializations
 - Can search for “tubulin” and find all isoforms
 - Can search for “tubulin-alpha” and be asked “No matches, do you want to see images of tubulin-beta?”
- Permits automatically find differences in reagents and associate them with differences in results

PSLID analysis results metadata

PSLID client and OMERO server

- PSLID client can connect to OMERO server to select images and create a PSLID set from them
- Currently: duplicated in PSLID server
- Planned: replace “plumbing” in PSLID server with calls to OMERO server
 - Feasibility tests completed

PSLID-OMERO

PUnMix: Pattern unmixing

- Many proteins (or other macromolecules) may be found in more than one organelle
- Features “see” each combination of organelles as a new pattern
- Can we “unmix” such mixed patterns?

- Assume that we have markers that are found in only one subcellular location (fundamental pattern)
- Assume that each fundamental pattern can be represented by some combination of distinct object types (e.g., 10% small round objects and 90% long skinny objects)
- Assume that a mixed pattern is formed by adding together the objects from fundamental patterns
- Then for each unknown image we can calculate the fraction of fluorescence in each object type, and then estimate how much of each fundamental pattern must be present

Find objects in each image

Learn object types from pure samples

Learn model for distributions of object types in pur samples

Determine pattern fractions for mixed images

Examples of Object Types

Type A

Type B

Type C

Type D

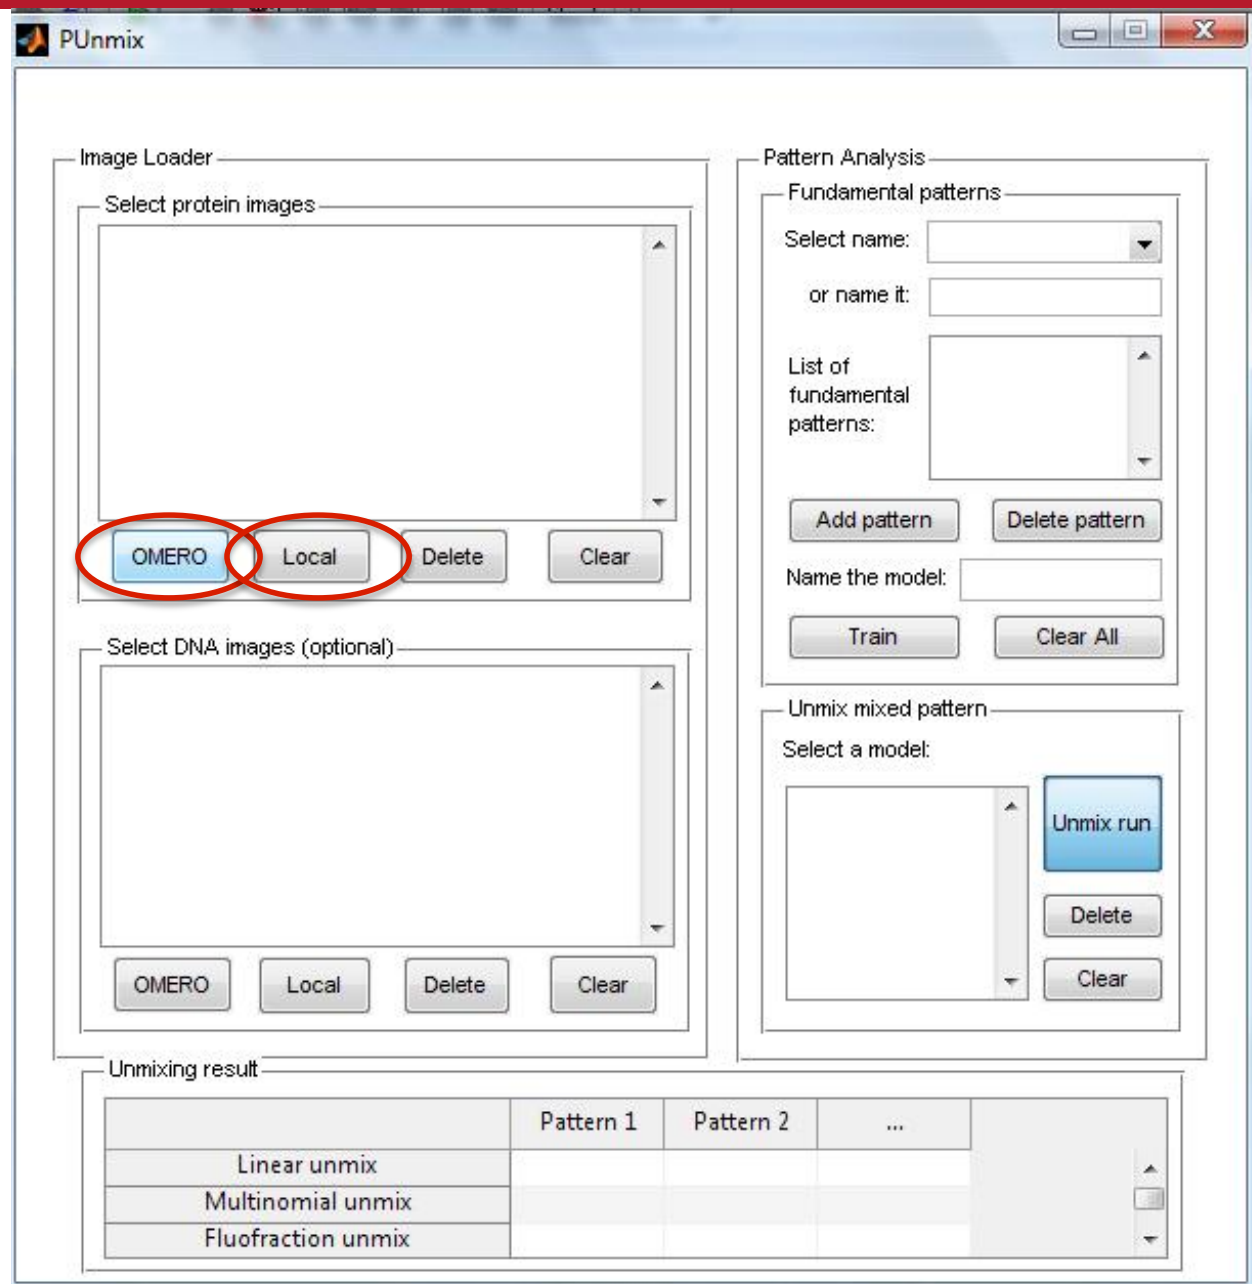

Supervised unmixing results

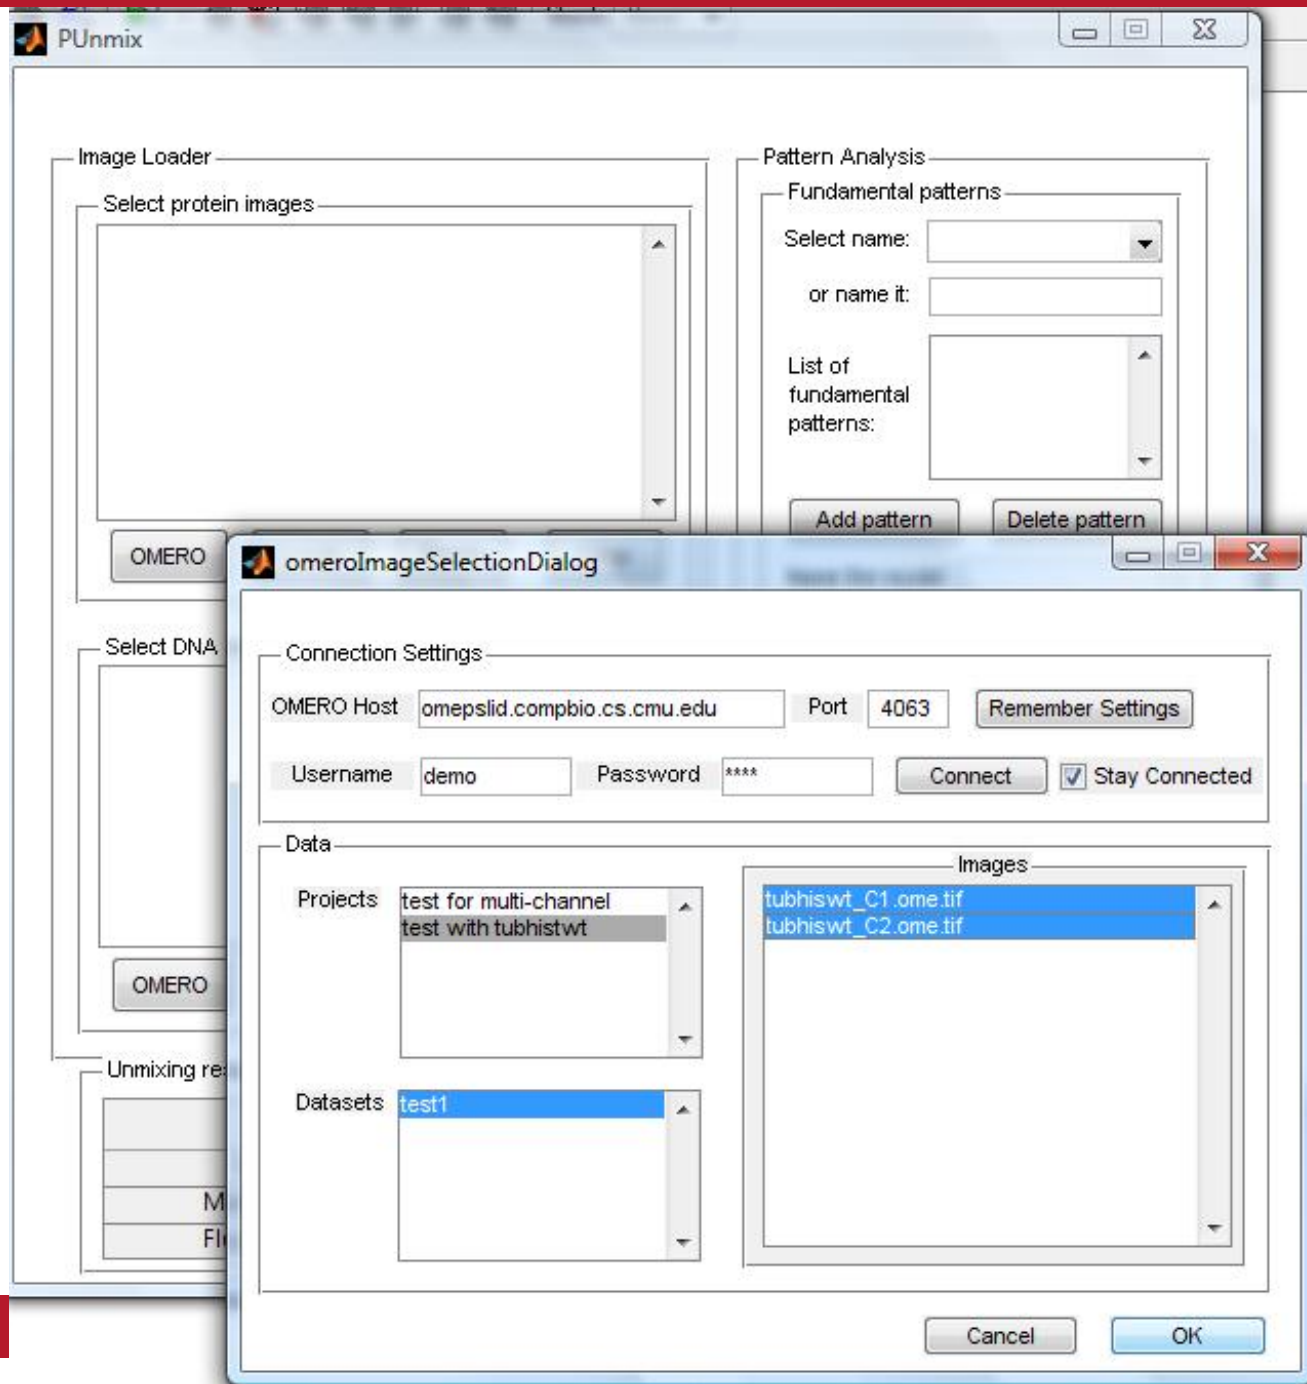

PUnmix and OMERO

- New PUnmix release July 11, 2010
- Versions
 - Matlab source
 - Compiled matlab for MacOS, Windows, Linux
- Supports training on or unmixing images from local disk or multiple OMERO servers

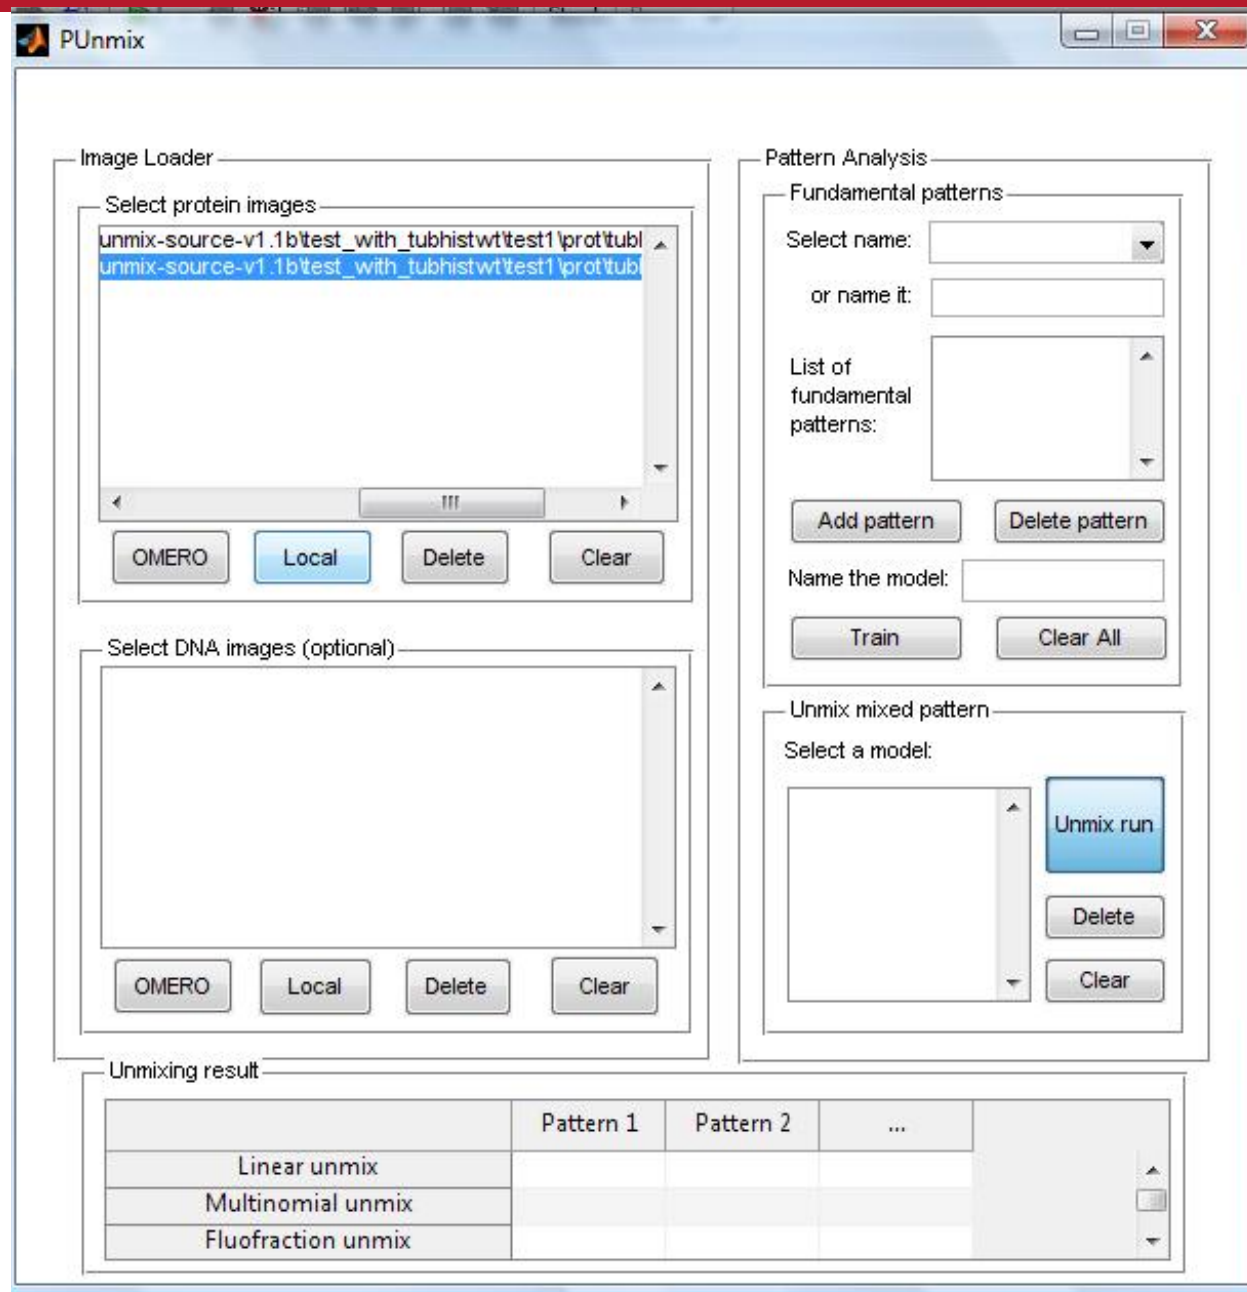

PUnmix GUI

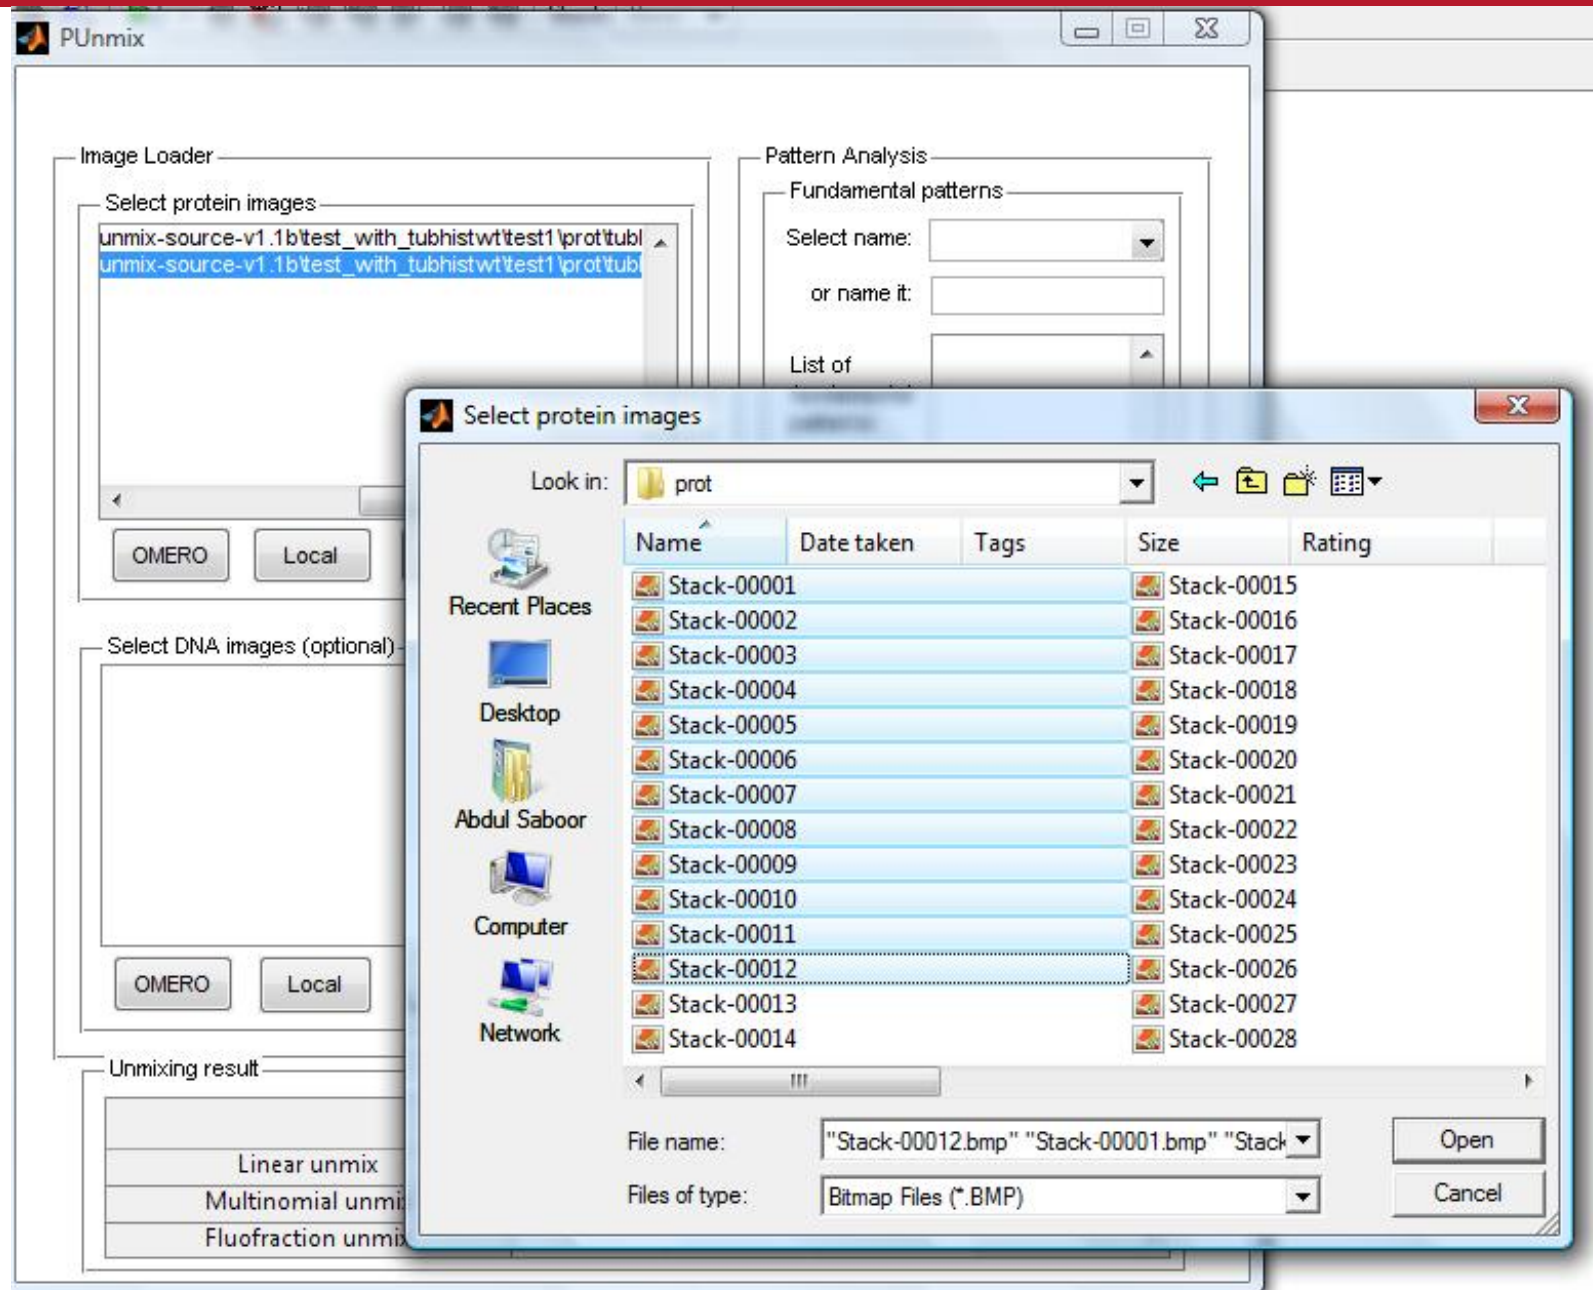

PUnmix GUI

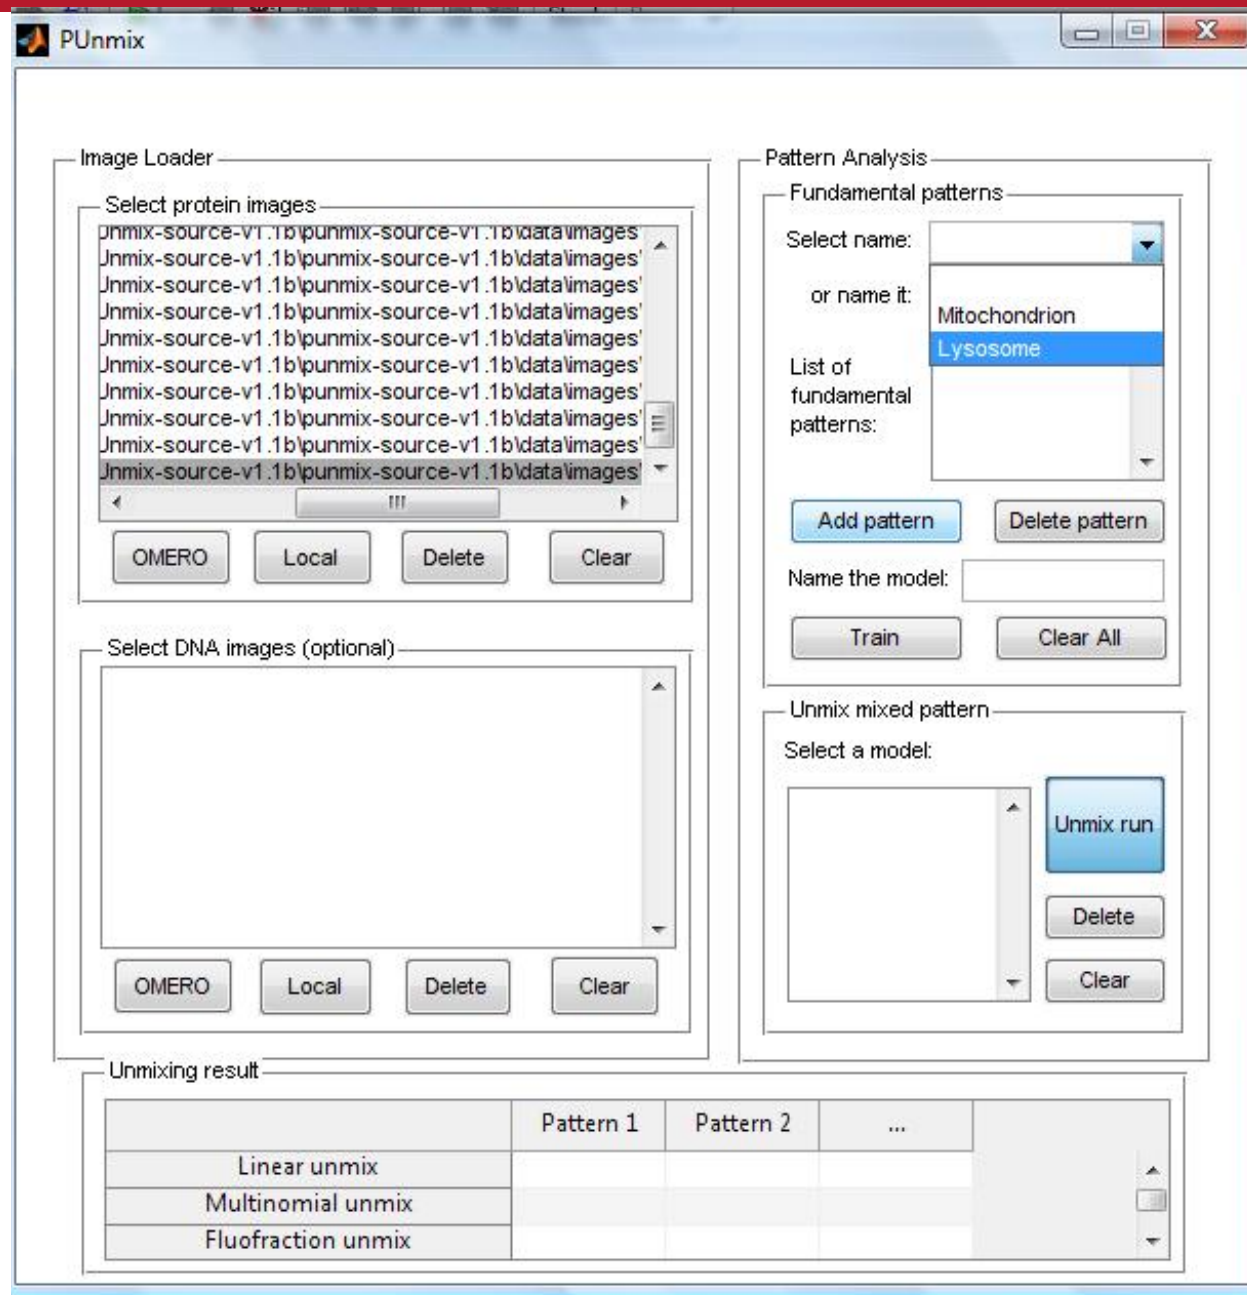

PUnmix after import from OMERO

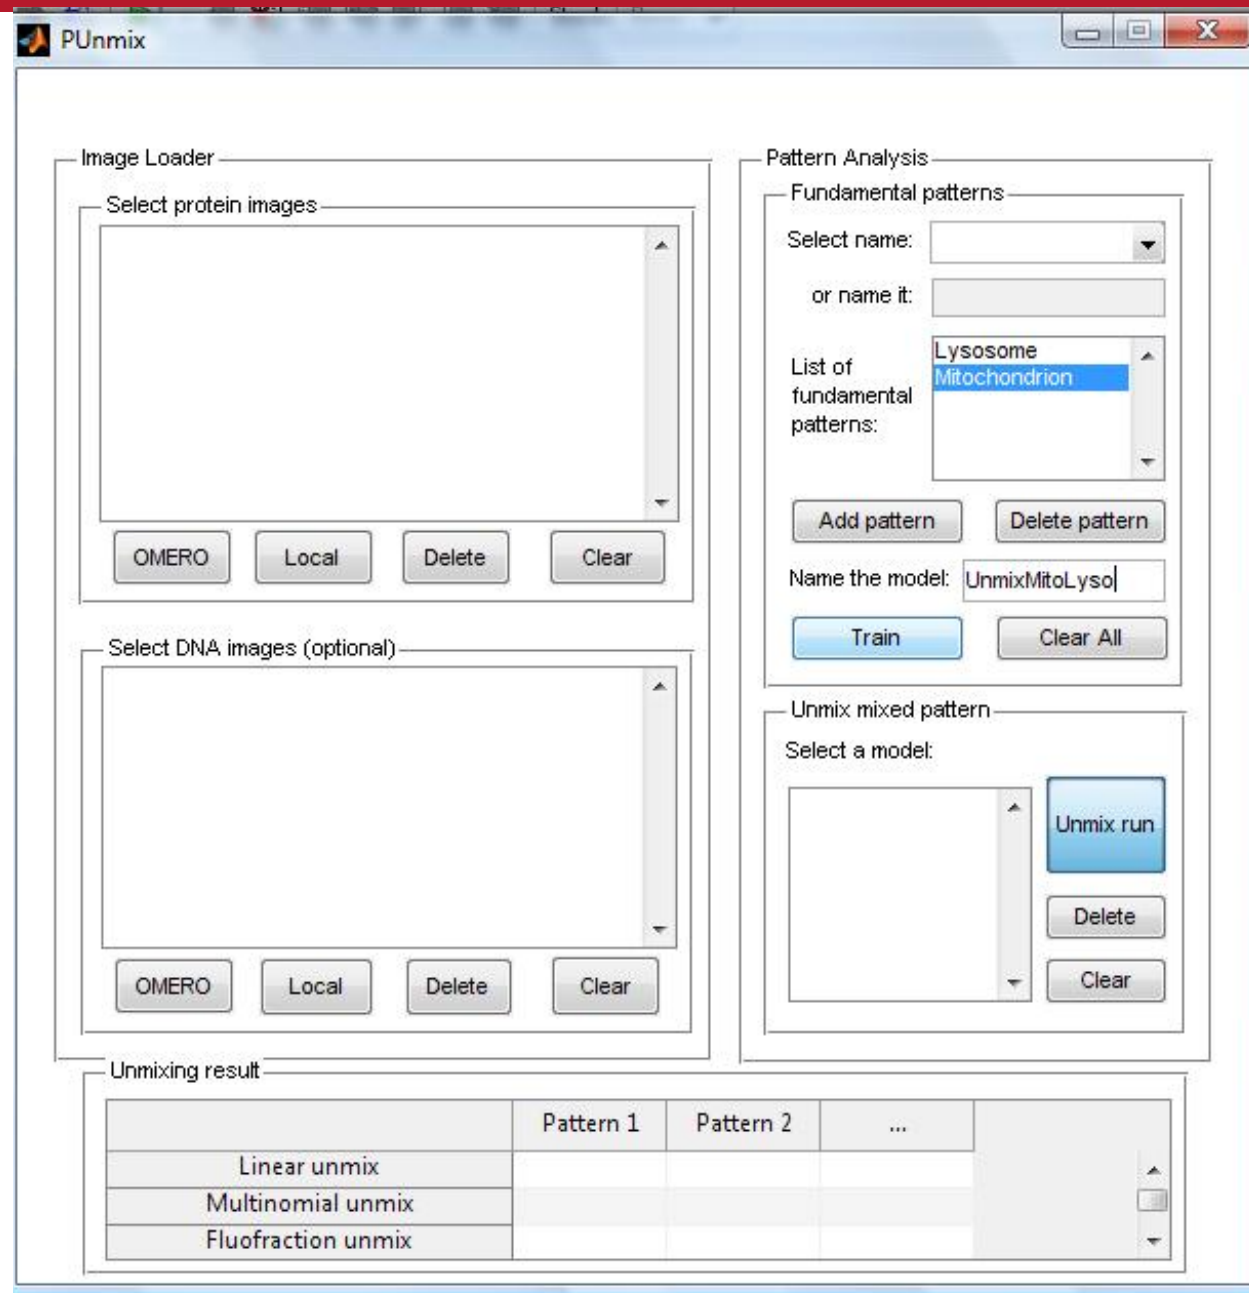

PUnmix adding local images

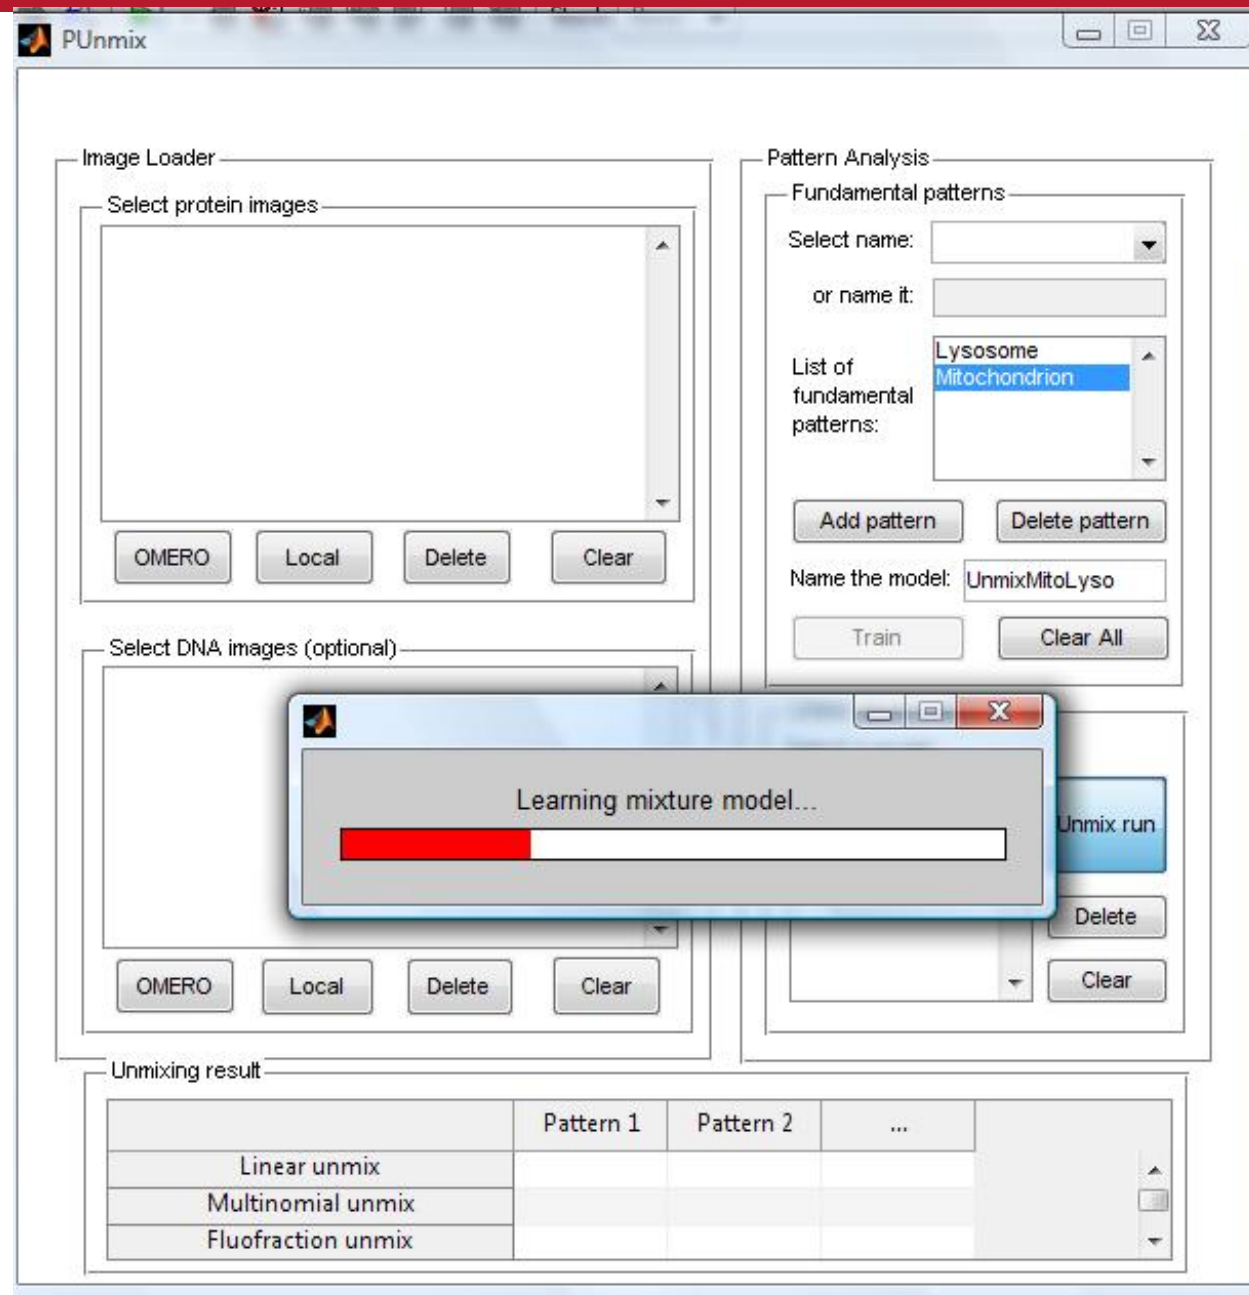

PUnmix training mixing model

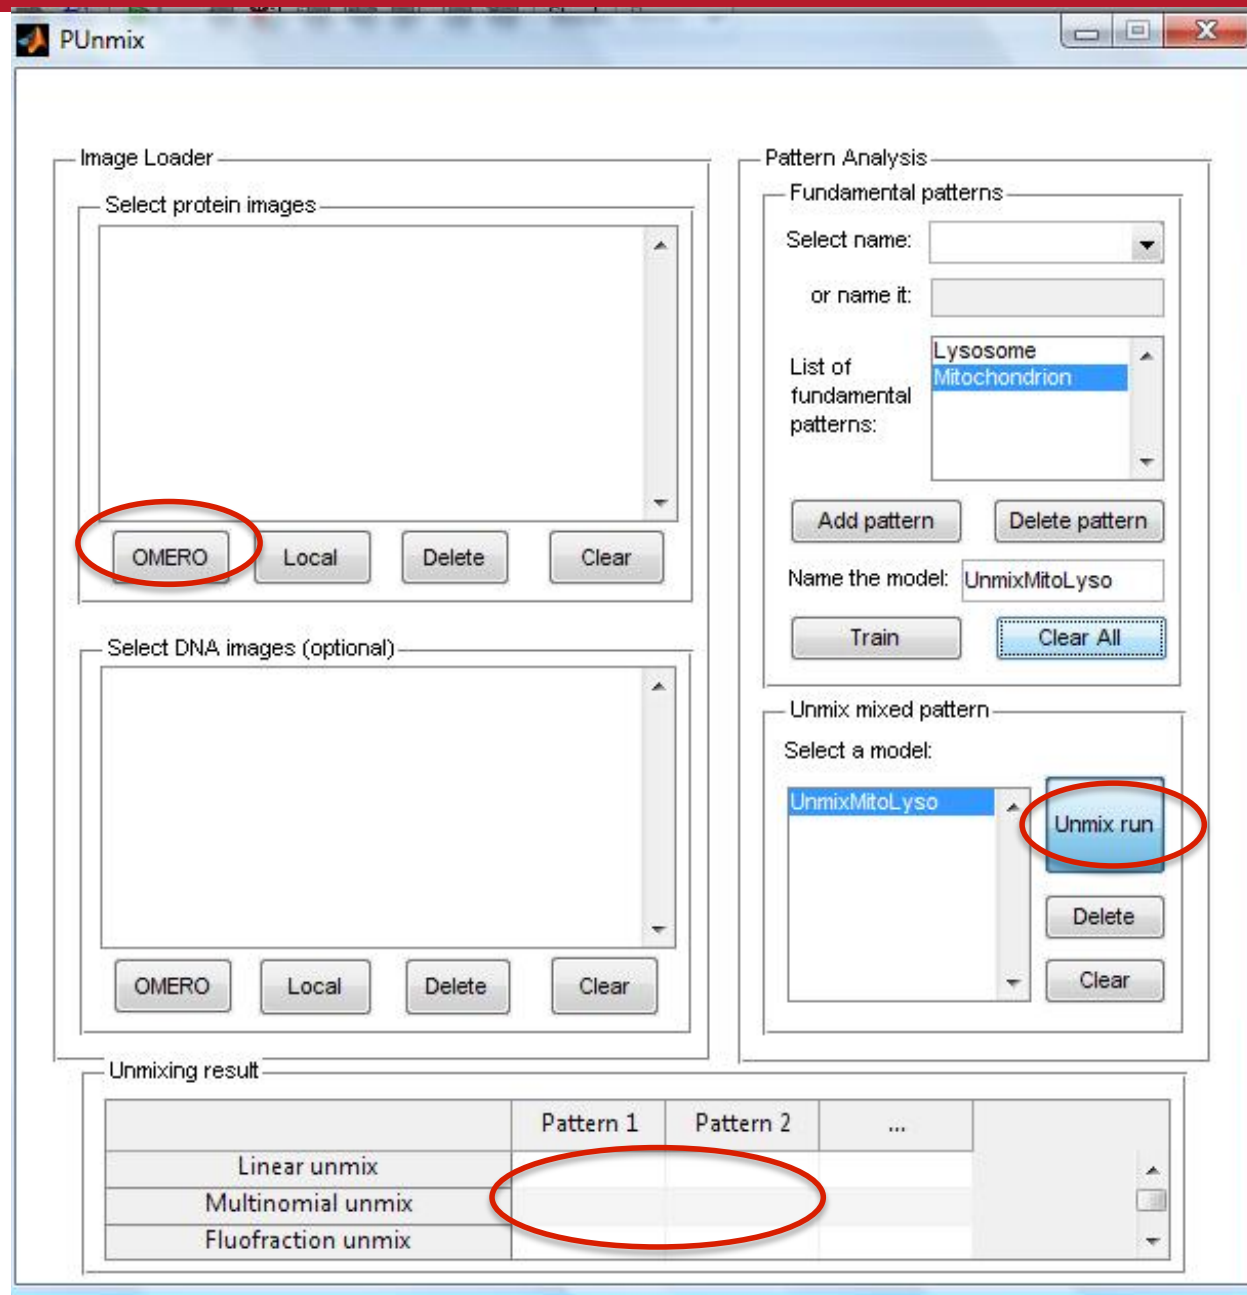

PUnmix training mixing model

PUnmix training mixing model

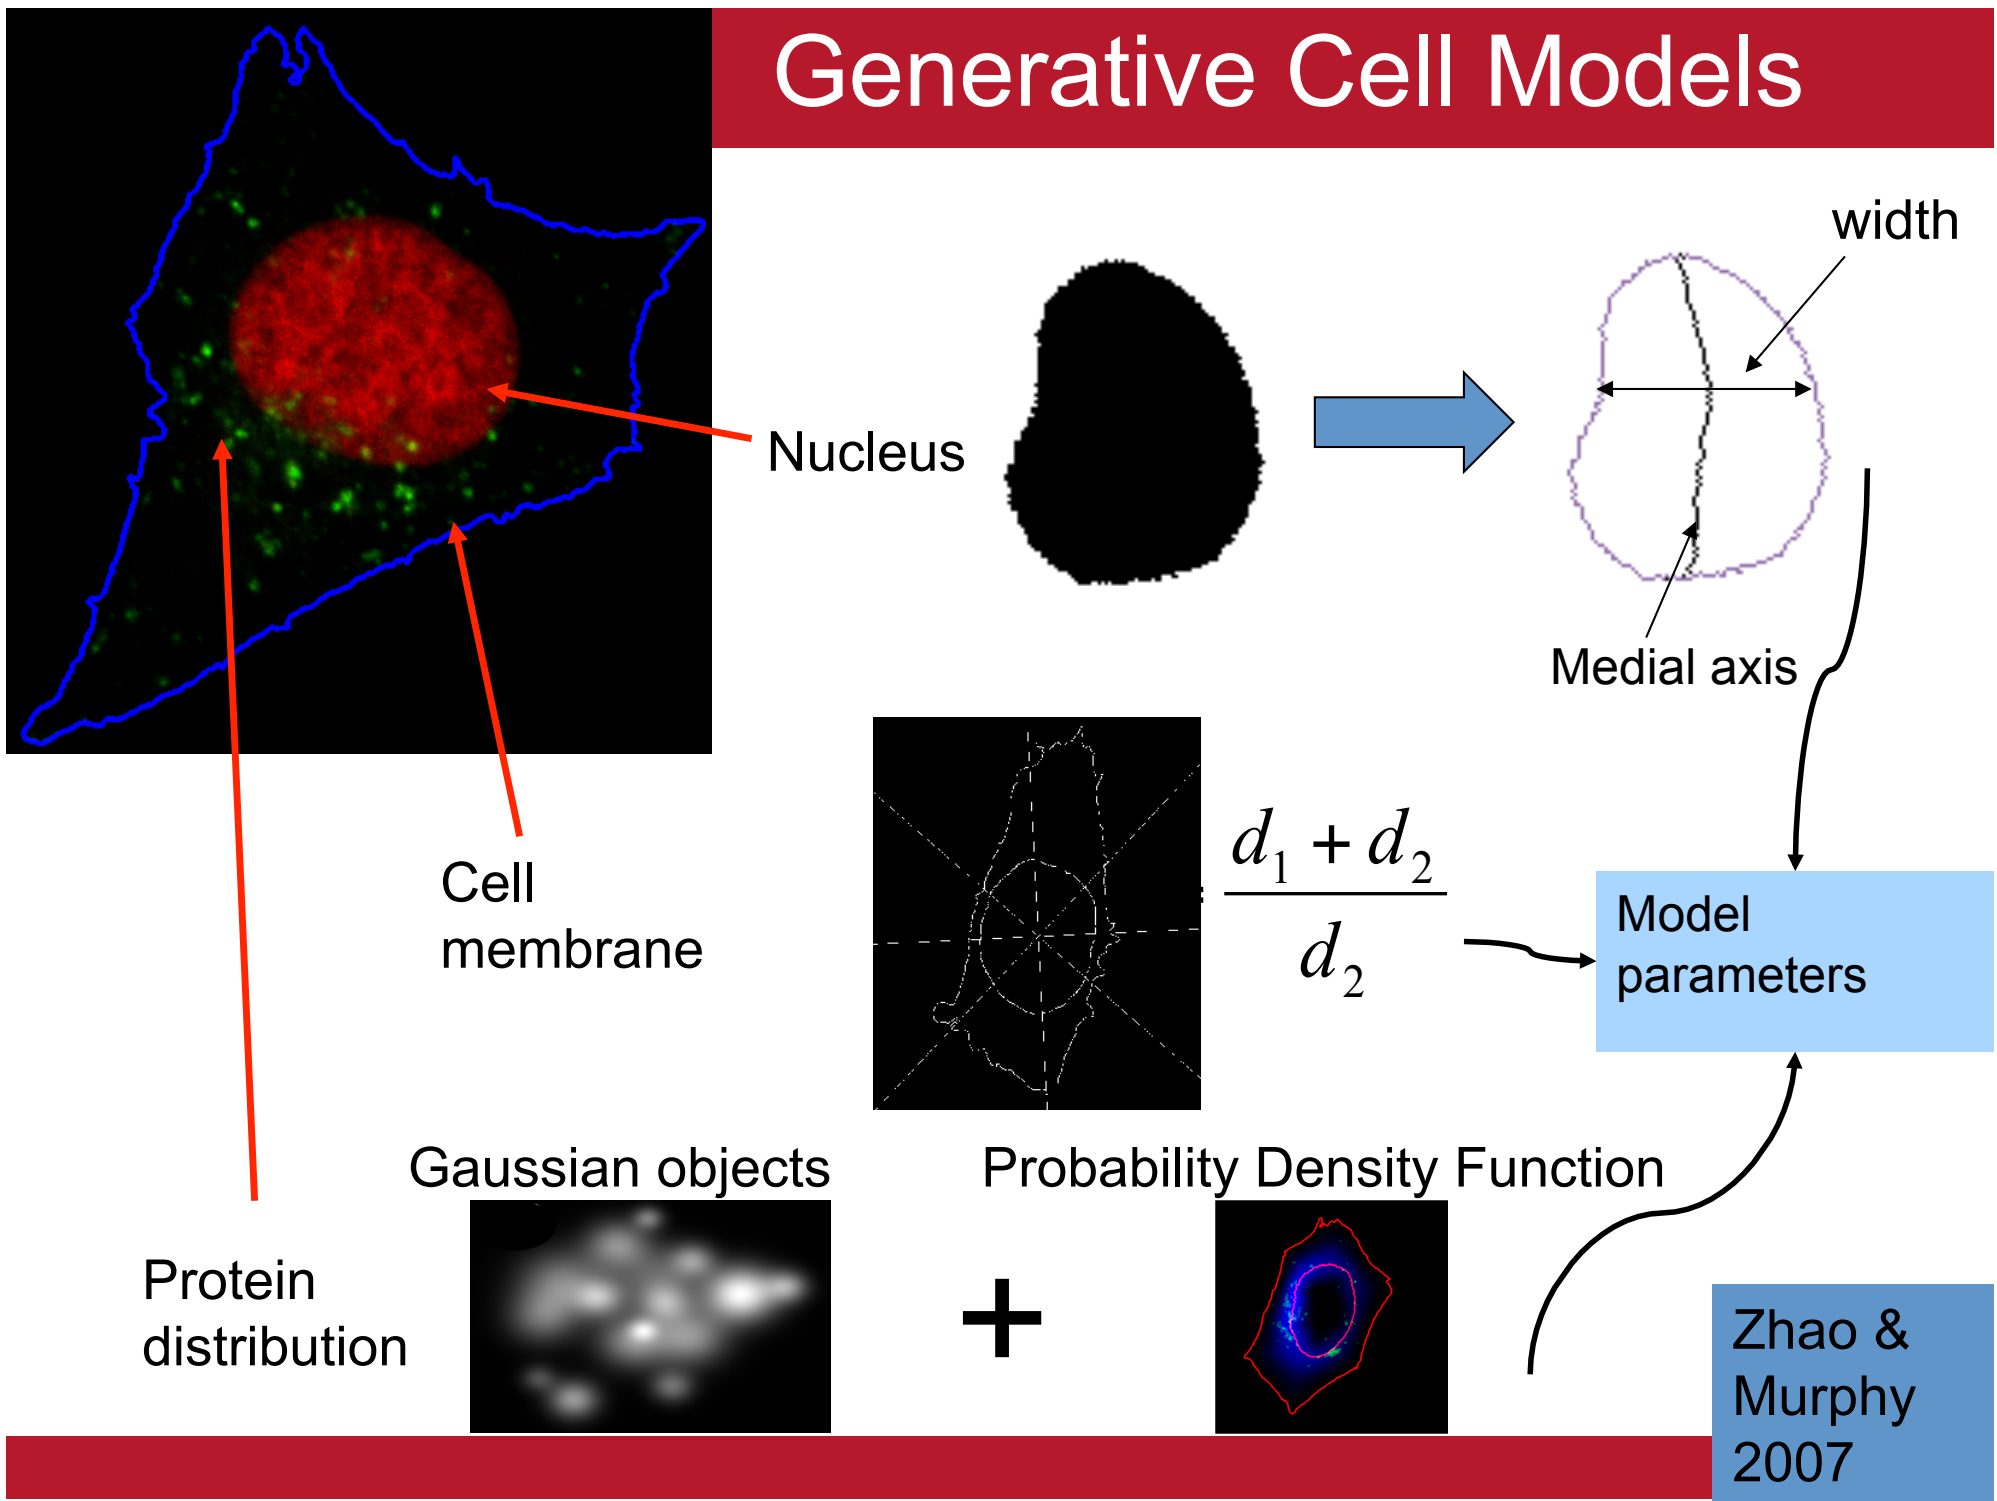

PUnmix training mixing model

SLML Suite

- SLML suite (Subcellular Location Markup Language) which can learn generative models of subcellular patterns from images and can synthesize new images from them

Generative Cell Models

Synthesized Images

Lysosomes

Endosomes

- SLML toolbox - Ivan Cao-Berg, Tao Peng, Ting Zhao
- Have portable tool for generating images from model

SLML Suite and OMERO

- Adding same OMERO read interface used by PUnMix
